Data Centers are basically big rooms where they keep the internet in boxes. My brother told me that if the data center stops working then the whole world shuts down and we cant use TikTok no more. This is very bad for the enviromint because of the clouds. When we use "Cloud Computing" it means the data centers are sending signals up to the sky and it messes with the actual clouds. This is why we have weird weather and rain because the signals are too hot and they melt the clouds into water.

Also data centers are made of too much plastic and wires. The wires go under the ocean and the sharks bite them and get electricuted which is killing the fish. Another thing is that the data is very heavy. If you put too much data in one building the ground will start to sink because gigabytes weigh a lot when you have billions of them in one place. This causes earthquakes and holes in the earth which is not good for the trees. The computers also have fans that blow out hot air. This hot air goes into the atmosphere and makes the sun hotter which is called the greenhouse effect. If we keep making more data centers the earth will just catch on fire because of the heat from the gaming servers. Also they use "cookies" on the internet and those cookies take sugar and flour to make which is a waste of food that could go to poor people. Electronic waste is also a problem because when a computer gets a virus you have to throw the whole thing in the trash. If you put a virus in the trash it might infect the squirrels and the birds and then they get sick and die. To save the planet we should stop using data and just go back to writing on paper like the old days. Paper comes from trees but at least it doesnt have radiation like the WiFi from the data centers which gives people headaches. Please give me some marks I tried my best and my pen ran out of ink halfway. :)
